AutoCAD Architecture and License Models The AutoCAD product line has evolved from three distinct versions (Legacy, LC, and Classic), through the current 2014 release of AutoCAD LT, to AutoCAD Pro, now the most advanced version of the product. Before introducing AutoCAD, Autodesk designed and built FrameMaker, an authoring tool for desktop publishing. FrameMaker was very successful and was used as a model for AutoCAD's authoring interface and tools.

AutoCAD's relatively slow start up speed was also partly due to the fact that it was a new product. The most significant evolution in the AutoCAD product line was the introduction of the Light Crea-ture (LC) product, which was released in August 1995. LC was designed to help new users get up and running with AutoCAD more quickly. Some of LC's features include: 1) A new user interface (GUI). LC has two different GUIs: the Blue screen, and the Red screen, which were primarily intended to suit very new and very experienced AutoCAD users respectively. 2) A toolbar. This toolbar provided key functionality in LC, such as an undo/redo function, a text tool, and rulers. The toolbar also provided the initial user interface for many functional features in AutoCAD, including measuring, editing, and plotting. 3) An integrated graphics technology called Scene Info. The Scene Info technology was designed to help users with complex drawings. It could place annotations on specific coordinates or an annotation could be placed at the center of the drawing. Scene Info would automatically update when the user moved the annotated points. 4) A more detailed user interface. AutoCAD provided detailed information about the drawing space, such as distances between the user's mouse and the object being drawn, distances between the user's mouse and other objects, and distances between the user's mouse and the end points of line segments. The new User Interface for AutoCAD LC 5) The ability to use these tools directly from the toolbar. Previous releases of AutoCAD did not directly provide direct access to these tools, as they were designed to be accessed

Document-based architecture A document-based architecture is common in CAD software in which all the data relating to the drawing is stored in documents. The documents are generally termed as.dwg, which is an abbreviation of "drawing", and.dgn, which is an abbreviation of "geometry". The.dwg and.dgn files are portable, editable, and hierarchical and therefore most CAD software automatically reads these files and renders the information. In contrast, the.dxf file is a Windows-specific binary file and does not have as much relationship to the drawing data. Some CAD applications allow the user to create.dwg and.dgn files directly from a drawing. These are converted to the.dwg and.dgn format by the CAD software. VPLS VPLS (Virtual

Prototyping Language Service), used in BIM 360, is based on a serialized data format named VPL.
