.net Framework Description:

The .net framework is an object-oriented implementation of the Common Language Runtime (CLR). The core framework provides services such as type marshaling, exceptions, security, threading, and a common virtual machine (the .NET Framework Class Library) for multiple operating systems (Windows CE, Pocket PC, and Windows NT) and for the different generations of Windows (Windows 2000, Windows XP, Windows Server 2003, and Windows Vista). The .NET framework can be used to develop software for the .NET platform, which includes the full .NET Framework Class Library and Microsoft Office applications. Currently, .NET Framework 3.5 supports the Common Language Runtime (CLR) version 2.0. The version 2.0 runtime environment contains an improved Just-In-Time (JIT) compiler and a number of core services that improve the stability, performance, and memory usage of .NET Framework applications. .NET Framework 3.5 contains the following core services:

- ☑ Threads and threads management
- ☑ Garbage collection
- ☑ Security services
- ☑ Metadata parsing and serialization
- ☑ Memory management and security
- ☑ Language binding
- ☑ Runtime environment
